HOMework 2

PROBLEM	TYPE	TOPIC	MAX. POINTS
1	Analytical	Filter Design	10
2	Analytical + Coding	Blob Detection	10
3	Coding	Corner Detection	10
4	Analytical	2D Transformation	10
5	Analytical	Interview Question	5

Motivation

In the previous homework, we have seen how to process images using convolutions and mine images for features such as edges using image gradients. In this homework, we will detect other types of useful features in images such as blobs and corners that can be useful for a variety of computer vision tasks. We then transition from detecting useful features in images to relating different images via 2D transformations.

The problem set consists of:

- analytical questions to solidify the concepts covered in the class; and
- coding questions to implement some of the algorithms described in class using Python.

Homework Layout

The homework consists of 5 problems in total, with subparts for each problem. There are 2 types of problems in this homework - analytical and coding. We encourage you to answer all the problems using the Overleaf document; however, handwritten solutions will also be accepted. The overleaf link is here: <https://www.overleaf.com/read/ggqwqzsgmcjn#d2fb52>. The coding jupyter notebook is: https://colab.research.google.com/drive/1Tp_8YKNiZ7HlvFE40yT9Z84t3DzwT1ac?usp=sharing

Submission

Submission will be done via Gradescope. You will need to submit three things: (1) this PDF with answers filled out, (2) Your .ipynb file, (3) a PDF printout of your .ipynb file with all cells executed. You do not need to create a folder, you will be able to upload all three files directly to gradescope.

1 Filter Design (10.0 points)

In the class you were taught the Central Difference/Laplacian filter for detecting the edges in an image (by computing the gradients along the horizontal and vertical directions). In the discussion we derived those filters by approximating the first (for gradient) and second derivative (for Laplacian) of a univariate function $f(x)$ using the Taylor series expansion of $f(x+h)$ and $f(x-h)$, where h is a small perturbation around x with $h = 1$ for the discrete case. These filters only consider the adjacent neighbours of the current pixel. In this question you will derive a high-order approximation for the two filters, such that the filters will use 2 adjacent neighbours. To summarize, you will be deriving a higher order approximation to the first/second derivative of $f(x)$. We will use $f^{(1)}(x), f^{(2)}(x)$ to denote the first and second derivative respectively.

1.1 Compute $f(x+h)$ (1.0 points)

Write the Taylor series approximation for $f(x+h)$ around $f(x)$, such that the approximation error tends to 0 as h^5 , i.e. consider only the first 5 terms in the Taylor series approximation. Use $f^{(1)}(x)$ for the first derivative, $f^{(2)}(x)$ for the second derivative and so on.

We can represent functions using a Taylor series approximation

$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$ centered around $f(a)$ so by using this, we approximate $f(x+h)$ around $f(x)$

$$f(x+h) = \sum_{n=0}^{\infty} \frac{f^{(n)}(x)}{n!} (x+h-x)^n = \sum_{n=0}^{\infty} \frac{f^{(n)}(x)}{n!} (h)^n$$
$$f(x+h) = f(x) + f^{(1)}(x)h + \frac{1}{2!}f^{(2)}(x)h^2 + \frac{1}{3!}f^{(3)}(x)h^3 + \frac{1}{4!}f^{(4)}(x)h^4$$

1.2 Compute $f(x-h)$ (1.0 points)

Similarly, write the Taylor series approximation for $f(x-h)$ around $f(x)$, such that the approximation error tends to 0 as h^5 .

As above, we follow the same thing

$$f(x-h) = \sum_{n=0}^{\infty} \frac{f^{(n)}(x)}{n!} (x-h-x)^n = \sum_{n=0}^{\infty} \frac{f^{(n)}(x)}{n!} (-h)^n$$
$$f(x-h) = f(x) - f^{(1)}(x)h + \frac{1}{2!}f^{(2)}(x)h^2 - \frac{1}{3!}f^{(3)}(x)h^3 + \frac{1}{4!}f^{(4)}(x)h^4$$

1.3 Compute $f(x+h) - f(x-h)$ (1.0 points)

Using the expressions you obtained in the previous two parts, compute the expression for $f(x+h) - f(x-h)$. You may assume that $\mathcal{O}(h^5)$ tends to 0, so that you can neglect the term. You will be using this result to compute a high-order approximation to $f^{(1)}(x)$.

The odd terms double up while the even terms will cancel out

$$f(x+h) - f(x-h) = f(x) + f^{(1)}(x)h + \frac{1}{2!}f^{(2)}(x)h^2 + \frac{1}{3!}f^{(3)}(x)h^3 + \frac{1}{4!}f^{(4)}(x)h^4 - (f(x) - f^{(1)}(x)h + \frac{1}{2!}f^{(2)}(x)h^2 - \frac{1}{3!}f^{(3)}(x)h^3 + \frac{1}{4!}f^{(4)}(x)h^4)$$

$$f(x+h) - f(x-h) = 2f^{(1)}(x)h + 2\frac{1}{3!}f^{(3)}(x)h^3$$

1.4 Unknowns at each pixel (1.0 points)

Let's assume that you have access to $f(x)$, which is a 1D signal (or equivalently one row in an image). This means that you can easily obtain the values for $f(x)$, $f(x \pm h)$, $f(x \pm 2h)$ and so on (assuming appropriate zero padding for start and end values). However, for each pixel x , if you only consider using its adjacent neighbours ($\pm h$), then the equation in the previous part has 2 unknowns. What are the two unknowns? *Note:* $h = 1$ for the discrete case, so h is not an unknown. But don't substitute $h = 1$ as of now; we will substitute it later.

The unknowns are $f^{(1)}(x)$ and $f^{(3)}(x)$

1.5 Compute $f^{(1)}(x)$ (1.0 points)

From the previous part, you know that for each pixel x , if we only consider $x \pm h$, then we have 1 equation and 2 variables (underdetermined system). To mitigate this issue, we consider two adjacent neighbours for each pixel ($x \pm 2h$) in addition to $x \pm h$. Replace h with $2h$ in the previous equation and you will get another equation for that pixel. So now, for each pixel, you have 2 equations and 2 variables. One equation should have $f(x \pm h)$ and the other should have $f(x \pm 2h)$. Using these two equations, solve for $f^{(1)}(x)$.

$$f(x+h) - f(x-h) = 2f^{(1)}(x)h + 2\frac{1}{3!}f^{(3)}(x)h^3$$

$$f(x+2h) - f(x-2h) = 2f^{(1)}(x)2h + 2\frac{1}{3!}f^{(3)}(x)(2h)^3 = 4f^{(1)}(x)h + 2\frac{8}{3!}f^{(3)}(x)h^3$$

Multiplying $f(x+h) - f(x-h)$ by -8 to get rid of $f^{(3)}(x)$

$$-8f(x+h) + 8f(x-h) = -16f^{(1)}(x)h - 2\frac{8}{3!}f^{(3)}(x)h^3 \text{ and adding it to } f(x+2h) - f(x-2h)$$

we get

$$-8f(x+h) + 8f(x-h) + f(x+2h) - f(x-2h) = (-16+4)f^{(1)}(x)h = (-12)f^{(1)}(x)h$$

$$f^{(1)}(x) = \frac{-f(x+2h) + 8f(x+h) - 8f(x-h) + f(x-2h)}{12h}$$

1.6 Convolution Kernel (1.0 points)

What is the convolution kernel corresponding to the new filter for $f^{(1)}(x)$? Substitute $h = 1$ for the discrete case. This filter is now a higher order central-difference filter which can be used to compute the gradients/edges.

for $h = 1$ $f^{(1)}(x) = \frac{-f(x+2)+8f(x+1)-8f(x-1)+f(x-2)}{12}$ and we can make the convolution kernel $f^{(1)}(x) = [-1, 8, 0, -8, 1]$

$$G_x = \begin{bmatrix} -1 & 8 & 0 & -8 & 1 \\ -1 & 8 & 0 & -8 & 1 \\ -1 & 8 & 0 & -8 & 1 \\ -1 & 8 & 0 & -8 & 1 \\ -1 & 8 & 0 & -8 & 1 \end{bmatrix}, G_y = \begin{bmatrix} -1 & -1 & -1 & -1 & -1 \\ 8 & 8 & 8 & 8 & 8 \\ 0 & 0 & 0 & 0 & 0 \\ -8 & -8 & -8 & -8 & -8 \\ 1 & 1 & 1 & 1 & 1 \end{bmatrix} \quad (1)$$

1.7 Laplacian Filter (1.0 points)

We will repeat the same exercise as the previous parts; however, now we compute a higher order approximation to the Laplacian filter. Similar to 1.3, compute the expression for $f(x+h) + f(x-h)$.

The even terms double up while the odd terms will cancel out

$$\begin{aligned} f(x+h) + f(x-h) &= f(x) + f^{(1)}(x)h + \frac{1}{2!}f^{(2)}(x)h^2 + \frac{1}{3!}f^{(3)}(x)h^3 + \frac{1}{4!}f^{(4)}(x)h^4 + (f(x) - f^{(1)}(x)h + \\ &\frac{1}{2!}f^{(2)}(x)h^2 - \frac{1}{3!}f^{(3)}(x)h^3 + \frac{1}{4!}f^{(4)}(x)h^4) \\ f(x+h) + f(x-h) &= 2f(x) + 2\frac{1}{2!}f^{(2)}(x)h^2 + 2\frac{1}{4!}f^{(4)}(x)h^4 \end{aligned}$$

1.8 Unknowns for the Laplacian (1.0 points)

Similar to 1.4, what are the two unknowns for each pixel in the expression from the previous part?

The unknowns are $f^{(2)}(x)$ and $f^{(4)}(x)$

1.9 Compute $f^{(2)}(x)$ (1.0 points)

Similar to 1.5, use $f(x \pm 2h)$ to solve for $f^{(2)}(x)$. Write the expression for $f^{(2)}(x)$.

$$\begin{aligned} f(x+h) + f(x-h) &= 2f(x) + 2\frac{1}{2!}f^{(2)}(x)h^2 + 2\frac{1}{4!}f^{(4)}(x)h^4 \\ f(x+2h) + f(x-2h) &= 2f(x) + 2\frac{1}{2!}f^{(2)}(x)(2h)^2 + 2\frac{1}{4!}f^{(4)}(x)(2h)^4 \\ \text{Multiplying } f(x+h) + f(x-h) \text{ by } -16 \text{ to get rid of } f^{(4)}(x) \\ -16f(x+h) - 16f(x-h) &= -32f(x) - 2\frac{16}{2!}f^{(2)}(x)h^2 - 2\frac{16}{4!}f^{(4)}(x)h^4 \\ f(x+2h) + f(x-2h) - 16f(x+h) - 16f(x-h) &= -30f(x) + -12f^{(2)}(x)h^2 \\ f^{(2)}(x) &= \frac{-f(x+2h)+16f(x+h)-30f(x)+16f(x-h)-f(x-2h)}{12h^2} \end{aligned}$$

1.10 Convolution Kernel (1.0 points)

What is the corresponding convolution for the filter you derived in the previous part? Use $h = 1$ for the discrete case.

$$f^{(2)}(x) = \frac{-f(x+2)+16f(x+1)-30f(x)+16f(x-1)-f(x-2)}{12}$$
$$f^{(1)}(x) = [-1, 16, -30, 16, -1]$$

$$G_x = \begin{bmatrix} -1 & 16 & -30 & 16 & -1 \\ -1 & 16 & -30 & 16 & -1 \\ -1 & 16 & -30 & 16 & -1 \\ -1 & 16 & -30 & 16 & -1 \\ -1 & 16 & -30 & 16 & -1 \end{bmatrix}, G_y = \begin{bmatrix} -1 & -1 & -1 & -1 & -1 \\ 16 & 16 & 16 & 16 & 16 \\ -30 & -30 & -30 & -30 & -30 \\ 16 & 16 & 16 & 16 & 16 \\ -1 & -1 & -1 & -1 & -1 \end{bmatrix} \quad (2)$$

2 Blob Detection (10.0 points)

In this question, you will be using the Laplacian of Gaussian (LoG) filter to detect blobs in an image. Let's consider a 2D Gaussian $G_{\sigma}(x,y) = \frac{1}{2\pi\sigma^2} e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)}$. Remember that we need to smooth the image using a Gaussian filter before computing the Laplacian to prevent noise amplification. However, instead of computing the Laplacian after filtering the image with a Gaussian kernel, we can directly filter the image with the Laplacian of Gaussian filter.

2.1 Compute $\frac{\partial^2 G_{\sigma}(x,y)}{\partial x^2}$ (1.0 points)

Write the expression for $\frac{\partial^2 G_{\sigma}(x,y)}{\partial x^2}$.

$$\begin{aligned}\frac{\partial G_{\sigma}(x,y)}{\partial x} &= G_{\sigma}(x,y) = \frac{1}{2\pi\sigma^2} e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} * \frac{-2x}{2\sigma^2} = \frac{1}{2\pi\sigma^2} \frac{-x}{\sigma^2} e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} \\ \frac{\partial^2 G_{\sigma}(x,y)}{\partial x^2} &= \frac{1}{2\pi\sigma^2} \left(-\frac{1}{\sigma^2} e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} + \frac{-x}{\sigma^2} * \frac{-x}{\sigma^2} e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} \right) \\ \frac{\partial^2 G_{\sigma}(x,y)}{\partial x^2} &= \frac{1}{2\pi\sigma^2} \left(\frac{x^2}{\sigma^4} - \frac{1}{\sigma^2} \right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} = \frac{1}{2\pi\sigma^2} \left(\frac{x^2 - \sigma^2}{\sigma^4} \right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)}\end{aligned}$$

2.2 Compute $\frac{\partial^2 G_{\sigma}(x,y)}{\partial y^2}$ (1.0 points)

Write the expression for $\frac{\partial^2 G_{\sigma}(x,y)}{\partial y^2}$.

By symmetry

$$\frac{\partial^2 G_{\sigma}(x,y)}{\partial y^2} = \frac{1}{2\pi\sigma^2} \left(\frac{y^2 - \sigma^2}{\sigma^4} \right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)}$$

2.3 Laplacian of a 2D Gaussian (1.0 points)

Using the results from the previous parts, write the expression for the Laplacian of a 2D Gaussian, $L(x,y)$.

$$\begin{aligned}
L(x,y) &= \frac{\partial^2 G_\sigma(x,y)}{\partial x^2} + \frac{\partial^2 G_\sigma(x,y)}{\partial y^2} \\
L(x,y) &= \frac{1}{2\pi\sigma^2} \left(\frac{x^2-\sigma^2}{\sigma^4}\right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} + \frac{1}{2\pi\sigma^2} \left(\frac{y^2-\sigma^2}{\sigma^4}\right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} \\
L(x,y) &= \frac{1}{2\pi\sigma^2} \left(\frac{x^2+y^2-2\sigma^2}{\sigma^4}\right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} = -\frac{1}{\pi\sigma^4} \left(\frac{-(x^2+y^2)+2\sigma^2}{2\sigma^2}\right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)} \\
L(x,y) &= -\frac{1}{\pi\sigma^4} \left(1 - \frac{(x^2+y^2)}{2\sigma^2}\right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)}
\end{aligned}$$

2.4 Scale-Normalization (1.0 points)

In class, we studied that it is important to normalize the scale of $L(x,y)$ before using it for blob detection. What is the normalization factor? Provide justification.

Instead of $-\frac{1}{\pi\sigma^4}$, we should use $-\frac{1}{\pi\sigma^2}$ so the entire equation becomes

$$L(x,y) = -\frac{1}{\pi\sigma^2} \left(1 - \frac{(x^2+y^2)}{2\sigma^2}\right) e^{-\left(\frac{x^2+y^2}{2\sigma^2}\right)}$$

It is important to normalize the scale of the Laplacian because without it, it will have a much larger response for larger size of blobs. It is also noted that we should multiply the nth derivative with σ^n and since LoG is a combination of second order derivatives, our factor should be σ^2 which helps normalize our scale and the response to become independent of the blob size

2.5 LoG Filter (1.0 points)

(See the Jupyter notebook) Using the expression for $L(x,y)$ and the scale normalization, write a Python function which will compute the LoG Filter.

```
def log_filter(size: int, sigma: float):
    endpoint = (size - 1) // 2
    log_size = np.linspace(-1 * endpoint, endpoint, size)
    log_fil = np.zeros((size, size))
    norm_factor = -(1/(np.pi * sigma**2))
    for x in range(size):
        for y in range(size):
            log_fil[x,y] = norm_factor * (1-(log_size[x]**2 + log_size[y]**2) /
            (2*sigma**2)) * np.exp(-1 * (log_size[x]**2 + log_size[y]**2) / (2*sigma**2))
    return log_fil
```

2.6 σ values (1.0 points)

(See the Jupyter notebook) What are the 5 sigma values which give the maximum response? To visualize the response, you can use the colormap in the Jupyter notebook.

The σ values that achieve maximum response are $\frac{r}{\sqrt{2}}$
The values will then be $\frac{5}{\sqrt{2}}, \frac{10}{\sqrt{2}}, \frac{15}{\sqrt{2}}, \frac{20}{\sqrt{2}}, \frac{35}{\sqrt{2}}$

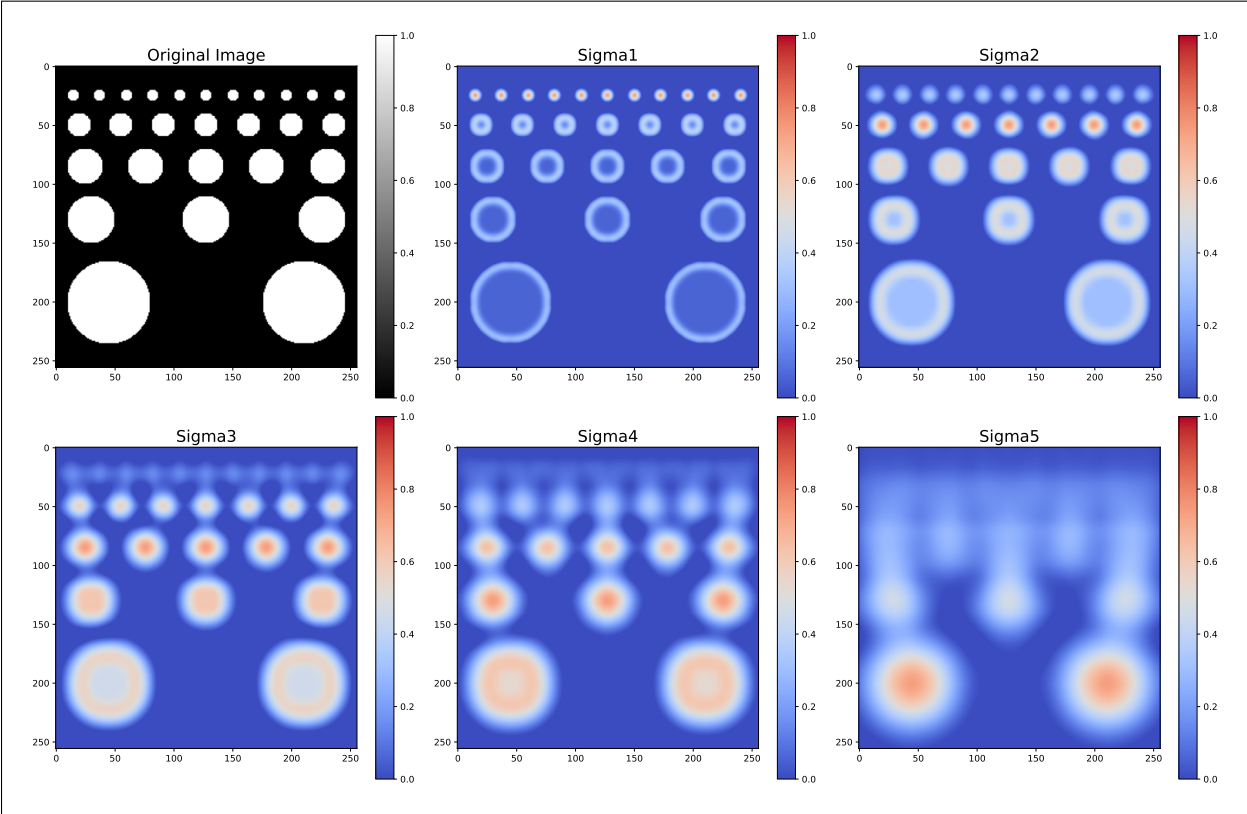

2.7 Visualize LoG Filter (1.0 points)

(See the Jupyter notebook) In this sub-part you will visualize the LoG filter. Copy the saved image from the Jupyter notebook here.

2.8 Visualize the blob detection results (3.0 points)

(See the Jupyter notebook) In this sub-part you will visualize the blob detection results. Copy the saved image from the Jupyter notebook here.

3 Corner Detection (10.0 points)

In this question, you will be implementing the Harris corner detector. As discussed in class, corners generally serve as useful features.

3.1 Computing Image Gradients Using Sobel Filter (1.0 points)

(See the Jupyter notebook). In this sub-part, you will write a function that computes image gradients using the Sobel filter. Make sure that your code is within the bounding box.

```
def compute_image_gradient(image: np.array):  
    xi = conv2D(image, sobel_x)  
    yi = conv2D(image, sobel_y)  
    return xi, yi
```

3.2 Visualizing the Image Gradients (1.0 points)

(See the Jupyter notebook). In this sub-part, you will visualize the image gradients. Copy the saved image from the Jupyter notebook here.

3.3 Computing the Covariance Matrix (1.0 points)

(See the Jupyter notebook). In this sub-part, you will write a function that computes the covariance matrix of the image gradients. Make sure that your code is within the bounding box.

```
def grad_covariance(image: np.array, size: int):  
    ix, iy = compute_image_gradient(image)  
    filter = average_filter(size)  
    ixx = conv2D(ix*ix, filter)  
    ixy = conv2D(ix*iy, filter)
```

```
iyy = conv2D(iy*iy, filter)
return ixx, ixy, iyy
```

3.4 Harris Corner Response (1.0 points)

(See the Jupyter notebook). In this sub-part, you will write a function that computes the Harris response function. Make sure that your code is within the bounding box.

```
def harris_response(image: np.array, k: float, size: int):
    ixx, ixy, iyy = grad_covariance(image, size)
    detM = (ixx * iyy) - (ixy**2)
    trace = ixx + iyy
    R = detM - k*(trace**2)
    return R
```

3.5 Visualizing the Harris Corner Detector (1.0 points)

(See the Jupyter notebook). In this sub-part, you will visualize the Harris corner detections. Copy the saved image from the Jupyter notebook here.

3.6 Thresholding the Harris Response (1.0 points)

To remove duplicate detections, you will write a function that applies non-maximum suppression to the Harris corner detections. To make writing this function easier, you will implement it in various parts.

(See the Jupyter notebook). In this sub-part, you will implement the first step of non-maximum suppression: thresholding the Harris response to obtain candidate corner detections. Make sure that your code is within the bounding box.

```
def threshold_harris_response(harris_response: np.array, threshold:
    ↪ float):
    index = np.argwhere(harris_response > threshold)
    return index
```

3.7 Sorting Candidate Detections (1.0 points)

(See the Jupyter notebook). In this sub-part, you will sort the candidate detections by maximum Harris response value. Make sure that your code is within the bounding box.

```
def sort_detections(candidate_detections: np.array, harris_response:
    → np.array):
    sorted = np.flip(np.argsort(harris_response[candidate_detections[:,0],
        candidate_detections[:,1]]))
    sorted_detects = candidate_detections[sorted]
    return sorted_detects
```

3.8 Suppressing Non-max Detections (1.0 points)

(See the Jupyter notebook). In this sub-part, you will implement the final step of non-maximum suppression: removing corner detections that are not local maxima. Make sure that your code is within the bounding box.

```
def local_max(sorted_detections: np.array, distance: float):
    local_maxs = []
    for i in sorted_detections:
        islocal = True
        for j in local_maxs:
            l2dist = l2_distance(i, j)
            if(l2dist < distance):
                islocal = False
        if islocal:
            local_maxs.append(i)
    return np.array(local_maxs)
```

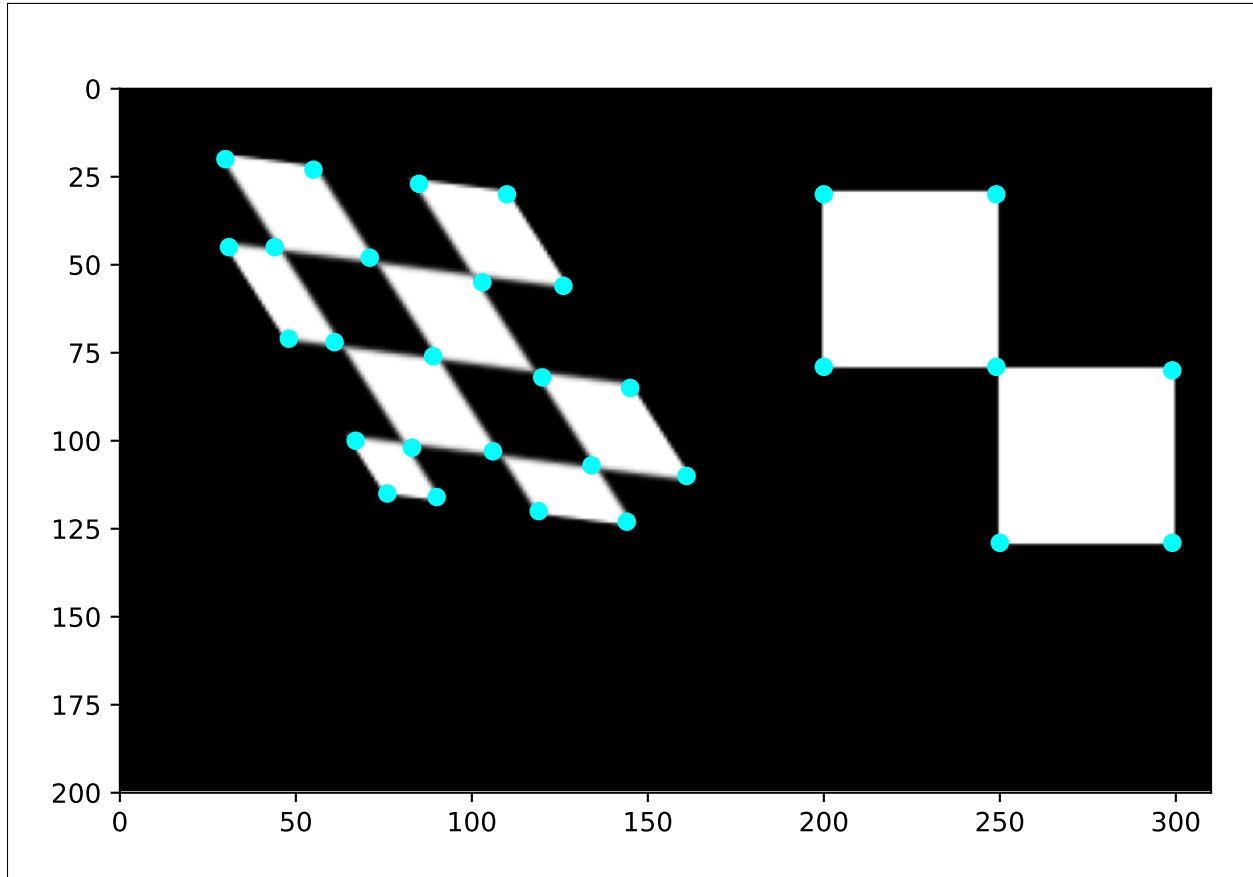

3.9 Non-Maximum Suppression: Putting it all together (1.0 points)

(See the Jupyter notebook). In this sub-part, you will write a function that performs non-maximum suppression on the Harris corner response. Make sure that your code is within the bounding box.

```
def non_max_suppression(harris_response: np.array, distance: float,
    → threshold: float):
    candidate_detections = threshold_harris_response(harris_response,
        → threshold)
    sorted_detects = sort_detections(candidate_detections, harris_response)
    return local_max(sorted_detects, distance)
```

3.10 Visualizing Harris Corner Detections + Non-maximum Suppression (1.0 points)

(See the Jupyter notebook). In this sub-part, you will visualize the Harris corner detections after non-maximum suppression has been applied. Copy the saved image from the Jupyter notebook here. Duplicate corner detections should now be removed.

4 2D Transformation (10.0 points)

In this question, you will be identifying different 2D transformations. You will be given a set of feature points x and the corresponding transformed points x' . Given these two set of points, you have to identify the 2D transformation. For the first 5 sub-parts, there is only one transformation (translation, scaling, rotation, shearing). For the next parts, there may be more than one transformation. While justifying your answer for each part you should also write the 3×3 transformation matrix M .

4.1 Example 1 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(2, 2), (3, 2), (3, 3), (2, 3)\}$. Identify the transformation and justify:

The transformation here is translation and $t_x = 1$ and $t_y = 1$ and using matrices we get

$$\begin{bmatrix} 2 & 3 & 3 & 2 \\ 2 & 2 & 3 & 3 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (3)$$

and we see that this holds

4.2 Example 2 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(0, \sqrt{2}), (\sqrt{2} - \frac{1}{\sqrt{2}}, \sqrt{2} + \frac{1}{\sqrt{2}}), (0, 2\sqrt{2}), (\frac{1}{\sqrt{2}} - \sqrt{2}, \sqrt{2} + \frac{1}{\sqrt{2}})\}$. Identify the transformation and justify:

The transformation here is a rotation and it is rotated 45 degrees where $\theta = 45$

$$\begin{bmatrix} 0 & \sqrt{2} - \frac{1}{\sqrt{2}} & 0 & \frac{1}{\sqrt{2}} - \sqrt{2} \\ \sqrt{2} & \sqrt{2} + \frac{1}{\sqrt{2}} & 2\sqrt{2} & \sqrt{2} + \frac{1}{\sqrt{2}} \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (4)$$

We can solve this matrix and see that it is

$$\begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} \frac{\sqrt{2}}{2} & -\frac{\sqrt{2}}{2} & 0 \\ \frac{\sqrt{2}}{2} & \frac{\sqrt{2}}{2} & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad (5)$$

4.3 Example 3 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(-1, 1), (-1, 2), (-2, 2), (-2, 1)\}$. Identify the transformation and justify:

This is another rotation but instead of 45 degrees, $\theta = 90$

$$\begin{bmatrix} -1 & -1 & -2 & -2 \\ 1 & 2 & 2 & 1 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (6)$$

We can solve this matrix and see that it is

$$\begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad (7)$$

4.4 Example 4 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(3, 5), (6, 5), (6, 10), (3, 10)\}$. Identify the transformation and justify:

This transformation is scaling with $sx = 3$ and $sy = 5$

$$\begin{bmatrix} 3 & 6 & 6 & 3 \\ 5 & 5 & 10 & 10 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (8)$$

and we see that this holds

4.5 Example 5 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(4, 6), (5, 11), (8, 12), (7, 7)\}$. Identify the transformation and justify:

The transformation here is shearing with $a=3$ and $b=5$

$$\begin{bmatrix} 4 & 5 & 8 & 7 \\ 6 & 11 & 12 & 7 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 3 & 0 \\ 5 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (9)$$

and we see that this holds

4.6 Example 6 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(0, 2), (0, 3), (-1, 3), (-1, 2)\}$. Identify the two transformations and their order and justify:

The two transformation is a rotation and then it is translated. It is rotated by 90 degrees and then 1 is added to both

$$\begin{bmatrix} 0 & 0 & -1 & -1 \\ 2 & 3 & 3 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (10)$$

$$\begin{bmatrix} 0 & 0 & -1 & -1 \\ 2 & 3 & 3 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (11)$$

$$\begin{bmatrix} 0 & 0 & -1 & -1 \\ 2 & 3 & 3 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -1 & 1 \\ 1 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (12)$$

4.7 Example 7 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(-2, 2), (-2, 3), (-3, 3), (-3, 2)\}$. Identify the two transformations and their order and justify:

The two transformation is a rotation and then it is translated. It is rotated by 90 degrees and then 1 is added to x and -1 to y

$$\begin{bmatrix} -2 & -2 & -3 & -3 \\ 2 & 3 & 3 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (13)$$

$$\begin{bmatrix} 0 & 0 & -1 & -1 \\ 2 & 3 & 3 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & -1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (14)$$

$$\begin{bmatrix} 0 & 0 & -1 & -1 \\ 2 & 3 & 3 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -1 & -1 \\ 1 & 0 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (15)$$

4.8 Example 8 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(4, 6), (7, 6), (7, 11), (4, 11)\}$. Identify the two transformations and their order and justify:

It is first scaled similar to 4.4 with the same parameters and then it is translated by 1 in both directions

$$\begin{bmatrix} 4 & 7 & 7 & 4 \\ 6 & 6 & 11 & 11 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 3 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (16)$$

$$\begin{bmatrix} 4 & 7 & 7 & 4 \\ 6 & 6 & 11 & 11 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 0 & 1 \\ 0 & 5 & 1 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (17)$$

4.9 Example 9 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(-5, 3), (-5, 6), (-10, 6), (-10, 3)\}$. Identify the two transformations and their order and justify:

It is first scaled similar to 4.4 with the same parameters and then it is rotated 90 degrees

$$\begin{bmatrix} -5 & -5 & -10 & -10 \\ 3 & 6 & 6 & 3 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 3 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (18)$$

$$\begin{bmatrix} -5 & -5 & -10 & -10 \\ 3 & 6 & 6 & 3 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 3 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (19)$$

$$\begin{bmatrix} -5 & -5 & -10 & -10 \\ 3 & 6 & 6 & 3 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -3 & 0 \\ -5 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (20)$$

4.10 Example 10 (1.0 points)

$x = \{(1, 1), (2, 1), (2, 2), (1, 2)\}$ and $x' = \{(-6, 4), (-11, 5), (-12, 8), (-7, 7)\}$. Identify the two transformations and their order and justify:

It is first sheared with the same parameters in 4.5 and then rotated 90 degrees

$$\begin{bmatrix} -6 & -11 & -12 & -7 \\ 4 & 5 & 8 & 7 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} \cos(\theta) & -\sin(\theta) & 0 \\ \sin(\theta) & \cos(\theta) & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 3 & 0 \\ 5 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (21)$$

$$\begin{bmatrix} -6 & -11 & -12 & -7 \\ 4 & 5 & 8 & 7 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 3 & 0 \\ 5 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (22)$$

$$\begin{bmatrix} -6 & -11 & -12 & -7 \\ 4 & 5 & 8 & 7 \\ 1 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} -5 & -1 & 0 \\ 1 & 3 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 2 & 2 & 1 \\ 1 & 1 & 2 & 2 \\ 1 & 1 & 1 & 1 \end{bmatrix} \quad (23)$$

5 Interview Question (5.0 points)

Object detection is a technique which allows computers to identify and localize objects in images/videos. Let us consider that we have an object detection system that finds cars in a given image. The object detection system will propose some candidates for the object. You can see multiple candidates for the car in Figure 1 (left), and the final bounding box for the car in Figure 1 (right). Each bounding box has a score which measures the likelihood of finding a car. Given the set of bounding boxes with their locations and their scores, propose a method for generating just one bounding box per object. Use one of the algorithms that has been covered in the class or even this homework.

Hint: One metric for measuring whether different bounding boxes are in the same local “neighborhood” is intersection over union (IoU), which is defined as follows:

$$\text{IoU}(\text{box1}, \text{box2}) = \frac{\text{Area of intersection of box1 and box2}}{\text{Area of union of box1 and box2}}.$$

Figure 1: (Left) The object detection system identifies many candidates for the location of the car. For each candidate, there is a score which measures how likely it is to find a car in that bounding box. You can see that there are multiple red boxes, where each box will have a score between 0-1. (Right) The final bounding box for the car.

Using the intersection over union, we can create an algorithm to choose/generate only one bounding box. We can use the scores of the bounding boxes and sort them in descending order. We can then select the box with the highest score as the proper bounding box. We then con-

tinue to compare the selected bounding box with the other remaining boxes by calculating the intersection over union (IoU) score. We can then set a predefined IoU threshold and bounding boxes with IoU scores above this threshold are overlapping. We then remove bounding boxes which are overlapping with the selected bounding box and then we add the selected box to another list so it can be excluded from the next iteration. We the repeat these steps and always select the highest score and then we continue until we have found all the bounding boxes. This algorithm is just description of the NMS, or Non-Maximum Suppression algorithm.
